Work summary – 29 Oct 2026

Project: Colive website rebuild (Next.js, `website-react`), branch `Dev`.
Status: all work is uncommitted on `Dev` (about 2,200 lines across 41 new files, plus a change to `next.config.ts`).

In short

Today's work added the two main browsing pages of the site, both built on the live Colive CRM API:

1. Property search/listing pages: city pages, locality pages and `/search`, with filters and sorting.
2. Property detail ("factsheet") pages: gallery, overview, reviews, room prices, amenities, offers, booking and schedule-visit panel.

URLs, filter query keys and behaviour follow the current colive.com site, so existing links and SEO URLs keep working.

1. Search / listing pages

Routes supported:

URL pattern	Example	Handled by
City page	`/pg-in-bangalore`, `/men-pg-in-bangalore`, `/pune`	`src/app/[...slug]/page.tsx`
Locality page	`/bangalore/pg-in-whitefield`, `/bangalore/central/pg-in-koramangala`	`src/app/[...slug]/page.tsx`
Place search from home page	`/search?loc=Whitefield, Bangalore&lat=..&long=..&rad=..`	`src/app/search/page.tsx`

Features:

- Property cards with price, discounted price, trending tag and variant tag.
- "Similar properties" section when results are thin; "No properties" state with links to other cities.
- Filter sidebar: sharing type (Solo / Couple / Shared), rent range slider (₹7,000–₹30,000), radius (5/10/25 km) and amenities.
- Sort: Default, Price high to low, Price low to high.
- Keyword search box.
- Filters are stored in the URL (same keys as colive.com, e.g. `?sharingtype=solo,couple&pricerange=7000,15000&amenities=ac`), so filtered results can be shared and bookmarked.
- Location highlights load lazily per card as it scrolls into view (new endpoint `/api/property-highlights/[link]`).
- Unknown cities or invalid paths return a 404 instead of an empty page.
- Loading skeletons and error pages for each route.

Key files: `src/lib/propertySearch.ts`, `src/lib/searchFilters.ts`, `src/lib/searchLocation.ts`, `src/components/search/*`.

2. Property detail pages

Routes supported:

- `/property/colive_179` (linked from `/search` results)
- `/bangalore/pg-in-mahadevpura/colive-179-signature-towers/colive_179` (linked from city pages)

Sections on the page:

- Header with breadcrumb, address and Google Maps link
- Photo gallery with 360° tour link and "Gold" ribbon for gold properties
- Overview and location highlights
- Standard features, guest reviews and rating
- Room types and booking plans with prices (loads separately so the rest of the page isn't held up)
- Current offers / coupon codes, amenities, food menu with meal timings (food properties only), and rent summary (charges and deposits)
- Sticky booking panel: "Book Now" goes to the existing colive.com booking flow, and the "Schedule Visit" form shows available time slots from the API (new endpoint `/api/visit-slots`)
- Page title, description and share image set per property for SEO

Key files: `src/lib/propertyDetails.ts`, `src/components/property/*`, `src/app/property/[link]/page.tsx`.

3. Configuration

- `next.config.ts`: allowed property images from `https://www.colive.com/utility/files/**` to load through Next.js image optimisation.
- API responses are cached (search results for minutes, property details for hours, filter lists for hours, highlights for days) to reduce load on the CRM API.

Open items / next steps

Item	Detail	Priority
Schedule Visit does not save	The form validates input and shows a confirmation, but does not send the visit to the CRM yet (same as the current colive.com page). It needs to be connected to the CRM visit-booking endpoint before go-live.	High
Hard-coded content	The Gold property list, the 8 standard features, meal timings and rent charges (e.g. CAM ₹345, payment handling ₹199) are hard-coded, as on colive.com. Changes to these will need a code update.	Medium
Commit and review	Today's work is not committed yet. It should be committed to `Dev` and reviewed before merging to `main`.	Medium
Testing	Check the pages against colive.com for several cities, localities and properties, on mobile and desktop.	Medium
